

AI SOLUTIONS SERVICE OVERVIEW

Draft Knowledge Base Document for Customer Service Agent / RAG System

Document Purpose

This document is prepared as a detailed AI Solutions Service Overview using the information currently available. It is designed to support a customer service AI agent, website FAQs, sales discussions, client onboarding, and RAG-based retrieval. Information that requires CEO or management confirmation is clearly marked as "To be confirmed by CEO" so it can be updated later without confusing the knowledge base.

Document Field	Details
Service Category	Artificial Intelligence (AI) Solutions
Business Context	Company offers AI solutions as one of its 8 major service areas, along with Digital Marketing, Cyber Security, Business Coaching, Accounting/Tax/Compliance, Corporate Law, HR Services, and Graphic Designing/Brand Development.
Target Use	Customer service agent, RAG knowledge base, sales documentation, client onboarding, service overview PDF.
Version	Draft v1 - based on currently available information.
Pending Inputs	Exact pricing, official support SLA, exact integrations, security standards, final technology stack, official sample deliverables, country-wise compliance notes.

Important RAG Note

For best RAG performance, each service should include clear sections for scope, inclusions, exclusions, timeline, deliverables, pricing model, customer responsibilities, support, FAQs, and escalation rules. This document follows that structure.

Table of Contents

- 1. Service Introduction
- 2. Customer Problems Solved
- 3. Objectives of the Service
- 4. Target Customers and Industries
- 5. Detailed AI Service Categories
- 6. Service Scope
- 7. Inclusions
- 8. Exclusions
- 9. Service Workflow
- 10. Timeline and Milestones
- 11. Deliverables
- 12. Pricing Approach
- 13. Expected Outcomes
- 14. Customer Responsibilities

- 23. Security, Privacy and Compliance
- 24. Support and Escalation
- 25. Related Services
- 26. Terms and Conditions
- 27. Sample Deliverables
- 28. Service Comparison
- 29. Frequently Asked Questions
- 30. Information Required from CEO

1. Service Introduction

Service Name

Artificial Intelligence (AI) Solutions

Short Description

AI Solutions help businesses automate repetitive tasks, improve customer support, manage leads, support HR activities, use company documents intelligently, generate business insights, and improve operational efficiency through AI-powered agents, chatbots, automation workflows, and custom AI systems.

Service Purpose

The purpose of this service is to help businesses use artificial intelligence in practical and measurable ways. The service is not limited to simple chatbot development. It can include AI customer service agents, AI HR agents, AI knowledge base assistants, AI lead qualification systems, AI workflow automations, multilingual AI support, and customized AI solutions depending on the client requirement.

Positioning Statement

The company can position AI Solutions as a business transformation service that combines consultation, requirement analysis, AI system design, implementation, deployment, training, and ongoing support.

Key Point	RAG-Friendly Answer
What is this service?	AI Solutions are technology services that help companies automate communication, operations, support, lead handling, document-based Q&A, and business workflows using artificial intelligence.
Who is it for?	It is suitable for startups, small businesses, growing companies, enterprises, service providers, education institutions, healthcare providers, real estate businesses, legal firms, accounting firms, HR teams, and digital-first businesses.
Main benefit	It reduces manual effort, improves response speed, increases productivity, and enables 24/7 intelligent customer or internal support.

2. Customer Problems Solved

Businesses usually approach AI service providers when they face delays, repetitive manual work, inconsistent communication, poor lead follow-up, limited staff availability, or difficulty managing large volumes of information. AI Solutions are designed to reduce these gaps.

- Customers wait too long for responses from support teams.
- Employees spend too much time answering repetitive questions.
- Leads are not followed up quickly, causing lost sales opportunities.
- Company information is scattered across PDFs, websites, policies, spreadsheets, and documents.
- HR teams manually screen resumes and answer repeated candidate queries.
- Sales teams struggle to qualify leads and maintain follow-ups.
- Business owners need dashboards, summaries, and insights from data.
- Clients from different countries need multilingual support.
- Teams need automation across CRM, email, website, WhatsApp, forms, and internal tools.

Customer Problem	AI Solution Response
Slow customer support	AI customer service agent can answer common questions instantly and escalate complex cases.
Repeated FAQs	AI chatbot or knowledge base assistant can answer repetitive queries from approved documents.
Lost leads	AI lead qualification agent can collect details, score leads, and route them to sales.
Manual HR screening	AI HR agent can assist with candidate screening, FAQ handling, and interview scheduling support.
Language barrier	Multilingual AI support can translate or answer in supported languages.

Unorganized knowledge	RAG-based knowledge assistant can retrieve answers from company PDFs, policies, and service documents.
-----------------------	--

3. Objectives of the AI Solutions Service

The AI Solutions service should be presented with clear objectives so that customers understand the business value instead of seeing AI as only a technical tool.

- Automate repetitive customer, sales, HR, and operational tasks.
- Provide 24/7 response capability through AI agents and chatbots.
- Improve customer experience by reducing response delays.
- Use company documents and knowledge bases for accurate answers.
- Support international clients through multilingual AI workflows.
- Reduce dependency on manual support for routine queries.
- Improve lead response time and lead qualification quality.
- Create scalable systems that can grow with the client business.
- Improve decision-making with AI summaries, dashboards, analytics, and reports.
- Integrate AI with existing business tools wherever feasible.

4. Target Customers and Industries

AI Solutions can be applied across many industries because almost every business has communication, data, support, sales, HR, or operational workflows that can be improved through automation.

Industry	Possible AI Use Cases
Healthcare	Patient FAQs, appointment assistance, clinic support, document-based information support.
Education	Admission query agent, student support chatbot, course recommendation assistant, multilingual admission support.
Real Estate	Lead qualification, property inquiry handling, follow-up automation, client document assistance.
E-commerce	Product FAQs, order support, refund query assistance, product recommendation support.
Legal Services	Client intake assistant, legal document FAQ support, appointment scheduling, compliance query routing.
Accounting and Tax	Document requirement assistant, compliance deadline reminders, client query support.
HR and Recruitment	Candidate screening, interview coordination, employee policy Q&A, onboarding support.
Digital Marketing Agencies	Lead capture, campaign reporting assistant, client query support.
Manufacturing	Internal knowledge assistant, vendor query support, workflow automation.
Consulting Businesses	Client onboarding assistant, proposal support, knowledge base assistant.

5. Detailed AI Service Categories

Below are the AI service categories that can be included in the AI Solutions service overview. The exact final list should be confirmed by the CEO, but the following categories are highly relevant based on the company context and customer service agent requirement.

Service Category	Description
AI Customer Service Agent	An AI agent that answers customer queries using approved service documents, policies, FAQs, website content, and knowledge base files. It can reduce manual support load and provide instant answers for common questions.

AI Knowledge Base Assistant	A RAG-based assistant that retrieves answers from company PDFs, service overviews, policy documents, website data, and structured knowledge folders.
AI HR Agent	An assistant for HR-related workflows such as candidate FAQs, resume screening support, candidate ranking support, interview scheduling assistance, onboarding Q&A, and employee policy support.
AI Lead Qualification Agent	An AI system that captures lead details, asks qualifying questions, identifies client needs, scores leads, and sends useful lead information to the sales or BDM team.
AI Sales Assistant	An assistant that supports sales teams with follow-up drafts, proposal assistance, service explanations, appointment booking support, and CRM updates.
AI Workflow Automation	Automation of repetitive business workflows using AI plus integration tools. Examples include form submission to CRM, email summaries, ticket classification, lead routing, and report generation.
AI Chatbot for Website	A website chatbot trained on company service documents and FAQs that can answer visitor queries and collect contact details.
Multilingual AI Support	AI support that can understand or respond in multiple languages such as English, German, French, Spanish, Arabic, Hindi, and other languages based on the target countries.
AI Analytics and Reporting Assistant	AI that summarizes data, reports, customer queries, sales activity, or operational dashboards into clear insights and action points.
Custom AI Solution Development	Tailor-made AI systems designed after understanding the client business process, workflows, documents, integrations, and goals.

6. Service Scope

The service scope defines what work is covered under AI Solutions. This is one of the most important sections for RAG because customers often ask what exactly is included.

Scope Area	Detailed Description
Consultation	Initial discussion to understand the client business, goals, current process, pain points, target users, and expected AI use cases.
Requirement Analysis	Collect requirements, documents, website links, policies, FAQs, sample customer queries, workflow details, and integration needs.
AI Solution Design	Design the AI agent flow, knowledge base structure, prompt strategy, fallback rules, escalation logic, integrations, and user experience.
Knowledge Base Preparation	Organize approved PDFs, service documents, policies, website content, FAQs, pricing notes, and process information in a RAG-friendly format.
Development	Build the chatbot, AI agent, backend, frontend, automation workflows, retrieval layer, and integrations as per agreed scope.
Testing	Test common queries, edge cases, multilingual queries, missing-information cases, hallucination control, escalation paths, and user experience.
Deployment	Deploy the solution to website, internal system, cloud server, CRM, or selected communication platform depending on project scope.
Training	Train client team on how to use, update, monitor, and improve the AI solution.
Support	Provide post-deployment support, bug fixes, improvements, and

7. What Is Included

The exact inclusion list should be finalized project-wise, but the following inclusions are suitable for the draft AI Solutions service overview.

- AI consultation and requirement understanding.
- Use-case identification and feasibility discussion.
- AI agent or chatbot design based on client goals.
- Knowledge base planning for RAG-based answers.
- Document organization guidance for service PDFs, policies, pricing files, and FAQs.
- Prompt design and response behavior rules.
- Basic conversation flow design.
- Development of agreed AI agent or chatbot features.
- Multilingual response support where included in project scope.
- Integration planning with website, forms, CRM, email, WhatsApp, Telegram, Slack, Google Workspace, or other platforms where feasible.
- Testing with sample customer questions.
- Fallback and escalation handling for unknown or complex queries.
- Admin or monitoring guidance if included.
- Deployment support.
- Basic documentation and handover.
- Post-launch improvement recommendations.

8. What Is Not Included

Exclusions prevent wrong customer expectations. These can be modified later based on official company policy.

- Website redesign or full website development unless separately included.
- Paid API, LLM, hosting, CRM, WhatsApp Business API, or third-party tool subscription costs unless included in the proposal.
- Legal, tax, accounting, medical, or financial advice generated by AI without professional review.
- Guaranteed business revenue, guaranteed conversion improvement, or guaranteed ranking results.
- Unlimited revisions unless mentioned in the project agreement.
- Data entry, document creation, or large-scale data cleanup beyond agreed scope.
- On-premise infrastructure setup unless separately included.
- Cyber security audit unless purchased as a separate service.
- Continuous human monitoring unless included in support package.
- Custom integrations not mentioned in the approved scope.

9. Service Workflow

This workflow can be used in the PDF and in the RAG knowledge base to answer questions such as "How does the AI service work?" or "What is the implementation process?"

1. Discovery Call - Understand the client business, problem, target users, and desired outcomes.
2. Requirement Collection - Collect websites, PDFs, policies, sample questions, current workflows, platforms, and integration needs.
3. Service Scope Confirmation - Define what will be included, excluded, timeline, deliverables, and pricing model.
4. Knowledge Base Preparation - Organize documents into service-wise folders and create RAG-friendly content.
5. Solution Architecture - Decide AI model, retrieval approach, backend, frontend, integrations, and deployment method.
6. Prototype or MVP Development - Build the first working version for selected use cases.
7. Testing and Validation - Test accuracy, missing information behavior, multilingual responses, response tone, and escalation logic.
8. Client Feedback - Collect feedback and revise flows, answers, FAQs, and UI behavior.
9. Final Deployment - Deploy the solution to the selected environment or communication channel.
10. Training and Handover - Provide instructions for usage, maintenance, updates, and best practices.
11. Ongoing Support and Optimization - Improve the solution based on usage logs, new documents, and customer query patterns.

10. Timeline and Milestones

Timelines vary depending on complexity, integrations, data readiness, approval speed, and deployment environment. The following estimates are draft ranges and should be confirmed by management before using in formal proposals.

Project Type	Estimated Timeline	Notes
Basic website chatbot	1-3 weeks	Suitable for FAQ-based support with limited integrations.
RAG-based customer service agent	2-6 weeks	Requires service documents, policies, FAQs, testing queries, and retrieval setup.
AI HR agent	3-8 weeks	Depends on resume screening, candidate workflows, HR documents, and integrations.
AI lead qualification agent	2-5 weeks	Depends on lead forms, CRM integration, qualification rules, and sales workflow.
Workflow automation with AI	2-8 weeks	Depends on number of workflows and platforms involved.
Enterprise custom AI solution	Custom timeline	Requires detailed discovery, architecture, security review, testing, and phased rollout.

11. Deliverables

Deliverables should be defined clearly in every AI project proposal. Below is a generic deliverable bank for AI Solutions.

Deliverable	Description
AI Agent or Chatbot	Functional AI assistant based on the approved use case.
Knowledge Base Structure	Organized folders and documents that the AI uses to answer queries.
Conversation Flow	Defined logic for greeting, query understanding, answering, fallback, and escalation.
Prompt and Behavior Rules	Instructions controlling tone, accuracy, escalation, and response boundaries.
Integration Setup	Connections with website, CRM, forms, email, WhatsApp, Telegram, Slack, or other tools if included.
Testing Report	List of tested queries, success cases, edge cases, and improvement areas.
Admin/Usage Guidance	Instructions for updating documents, checking logs, or maintaining the AI system.
Training Session or Notes	Training for client team on using and managing the AI solution.
Deployment Package	Live deployment or deployable files depending on agreement.
Support Plan	Post-launch support scope, contact method, and escalation process.

12. Pricing Approach

Exact pricing must come from the CEO or management. Until confirmed, the PDF should not mention exact prices. It can safely explain the pricing approach.

- Pricing may depend on project complexity, number of AI agents, data volume, integrations, multilingual support, custom UI, deployment method, support level, and maintenance requirements.
- Pricing may be offered as fixed project pricing, monthly retainer, subscription model, or custom quotation.
- Third-party costs such as LLM API usage, hosting, WhatsApp API, CRM subscription, database, storage, or paid tools may be charged separately unless included in the proposal.
- Final quotation should be shared only after requirement analysis and scope confirmation.

Pricing Factor	Impact on Cost
Number of AI agents	More agents or departments usually increase project effort.
Knowledge base size	More documents require more cleaning, structuring, testing, and retrieval optimization.
Integrations	CRM, WhatsApp, email, ERP, calendar, payment, or custom APIs add complexity.
Multilingual support	Additional testing and quality checks are needed for each language.
Security requirements	Enterprise security, access control, audit logs, and compliance increase effort.
Support plan	Long-term maintenance or SLA-based support may require monthly fees.

13. Expected Outcomes

AI outcomes should be communicated realistically. The company should avoid absolute guarantees and instead mention expected improvements depending on scope and data quality.

- Faster response to customer queries.
- Reduced manual workload for support, sales, HR, and operations teams.
- Better lead capture and initial qualification.
- Consistent service information across customer conversations.
- Improved availability through 24/7 AI assistance.
- Better organization of service documents and company knowledge.
- Improved multilingual communication for international clients.
- Improved reporting, summaries, and workflow visibility.
- Scalable support system that can be improved over time.

Disclaimer: AI performance depends on the quality of knowledge base documents, clarity of business rules, proper testing, integrations, and ongoing updates. The AI should not be positioned as a replacement for professional judgment in legal, accounting, tax, medical, or other regulated areas.

14. Customer Responsibilities

Customer responsibilities are essential because AI systems cannot answer accurately without correct source information and timely approvals.

- Provide accurate business details, service details, policies, FAQs, pricing guidance, and existing customer query examples.
- Provide website links, service documents, brochures, policy PDFs, process documents, and knowledge base files.
- Confirm what the AI is allowed and not allowed to answer.
- Provide access to required platforms only when integration is included.
- Review and approve knowledge base content before deployment.
- Provide sample questions in different languages if multilingual support is required.
- Give timely feedback during testing and revision phases.
- Inform the company when service details, pricing, policies, or terms change.
- Maintain legal and compliance responsibility for regulated service answers where applicable.

15. Company Responsibilities

The company responsibilities should be presented clearly so customers understand what support they will receive.

- Understand the client requirement and recommend a suitable AI solution.
- Design and develop the AI solution according to agreed scope.
- Use approved documents and content to create or structure the knowledge base.
- Implement fallback behavior when information is missing or uncertain.
- Test the AI system using sample queries before deployment.
- Provide basic documentation and handover guidance.
- Maintain confidentiality of client data and project information.
- Provide post-deployment support as per agreed support plan.

- Recommend improvements based on user queries, logs, feedback, and new requirements.

16. Technologies and Tools

The exact official technology stack must be confirmed. The following list can be used as a draft technology bank. Do not present all tools as guaranteed unless management confirms them.

Technology/Tool	Possible Purpose
Python	Backend development, AI workflows, APIs, automation scripts.
FastAPI	Building APIs for AI agents and web/mobile integrations.
LangChain / LangGraph	AI agent workflows, tool calling, memory, and orchestration.
OpenAI / Gemini / Claude / Other LLMs	Natural language understanding and response generation.
Vector Database such as FAISS / Chroma / Pinecone	Document retrieval for RAG-based knowledge assistants.
PostgreSQL / MySQL	Storing structured data, leads, logs, users, tickets, or analytics.
n8n / Zapier / Make	Workflow automation and integrations.
Docker	Packaging and deployment support.
Cloud Hosting	Deployment on cloud platforms, subject to project requirement.
Website Widget / Chat UI	Frontend interface for customers or internal users.

17. Integrations Supported

The integration list must be confirmed by the CEO and technical team. The following can be shown as possible integrations depending on feasibility and project scope.

- Website chat widget.
- CRM systems for lead capture and follow-up.
- Email for notifications, summaries, and support routing.
- Google Workspace for Gmail, Sheets, Calendar, and Drive workflows where applicable.
- Microsoft 365 and Teams where applicable.
- WhatsApp Business API where officially supported and configured.
- Telegram, Slack, or other messaging platforms where required.
- Forms such as website forms, Google Forms, or custom forms.
- Ticketing systems for support escalation.
- Internal databases and dashboards where approved.

18. Packages and Customization

Packages can help customers understand options, but official packages must come from management. The table below is a draft structure.

Package Type	Suitable For	Possible Features
Basic AI Assistant	Small businesses needing FAQ support	Website chatbot, limited knowledge base, basic FAQs, basic testing.
Professional AI Agent	Growing businesses needing customer support or lead handling	RAG knowledge base, lead capture, service FAQs, escalation, multilingual option, basic integration.
Business Automation AI	Teams needing workflow automation	AI agent plus email/CRM/forms workflow automation, reporting, and process triggers.
Enterprise Custom AI	Larger clients with complex needs	Custom architecture, multiple agents, advanced integrations, security review, custom reporting, phased deployment.

Customization may include industry-specific workflows, country-specific language support, custom tone, custom branding, escalation rules, integration with existing systems, and role-based access if required.

19. Use Cases

Use Case	Description
Customer Service Agent	A company wants a 24/7 support agent that answers service-related questions from PDFs and websites. The AI can answer FAQs, explain scope, collect contact details, and escalate unclear questions.
Education Admission Agent	A school or college wants to answer admission queries in multiple languages. The AI can explain courses, documents needed, eligibility, fees if approved, deadlines, and contact process.
Hospital or Clinic Assistant	A healthcare business wants appointment support and general service FAQs. The AI can explain available services and direct urgent or medical advice queries to human staff.
Real Estate Lead Agent	A real estate company wants to capture buyer requirements. The AI asks budget, location, property type, timeline, and forwards qualified leads to sales.
HR Recruitment Agent	An HR team wants help with candidate FAQs and resume screening support. The AI can collect candidate details, answer process questions, and assist initial ranking based on defined criteria.
Legal/Accounting Client Intake Agent	A professional service firm wants to collect client requirements before consultation. The AI can ask structured questions and route the case to experts without providing final legal or tax advice.
Internal Knowledge Assistant	A company wants employees to ask questions from policies, SOPs, training manuals, and internal documents. The AI retrieves approved answers and reduces internal dependency.
Digital Marketing Client Support	A digital marketing agency wants clients to understand reports, SEO terms, campaign status, and deliverables. The AI explains report sections and routes complex strategy questions.

20. Success Metrics and KPIs

KPIs help evaluate whether the AI solution is producing useful results. Actual KPIs should be selected based on the project type.

KPI	Meaning
Response time	How quickly the AI responds to users.
Query resolution rate	Percentage of queries answered without human escalation.
Escalation rate	Percentage of queries sent to human support.
Lead capture rate	Number or percentage of users who submit lead details.
Lead qualification quality	How useful the collected lead information is for sales teams.
Customer satisfaction	Feedback score from users interacting with the AI.
Knowledge base coverage	How many common queries are covered by approved documents.
Multilingual accuracy	Quality of answers in supported languages.
Automation success rate	Percentage of workflow automations completed without manual correction.
Time saved	Estimated hours saved for support, HR, sales, or operations teams.

21. Reporting Structure

Reporting should be included when the project has ongoing support or usage tracking. Reporting frequency must be confirmed in the proposal.

- Weekly or monthly query summary.
- Top customer questions asked.
- Unanswered or escalated queries.
- Knowledge base gaps identified by the AI.
- Lead capture summary if lead generation is included.
- Language-wise query summary for multilingual deployments.
- User satisfaction or feedback summary if feedback is collected.
- Recommendations for improving FAQs and service documents.

22. Country and Language Support

The company context mentions service availability across multiple countries. Exact country list and official language list should be confirmed by the CEO. For now, the AI Solutions PDF can explain multilingual capability as a configurable feature.

- AI solutions can be designed to support international clients and multilingual customer queries.
- Language support may include English and additional languages based on target countries, such as German, French, Spanish, Arabic, Hindi, and others.
- For high accuracy, each language should be tested with sample customer questions and approved service answers.
- Country-specific legal, tax, compliance, or policy answers should be handled carefully and should use confirmed local information.
- Where jurisdiction-specific details are missing, the AI should escalate or ask the customer to contact the company representative.

23. Security, Privacy and Compliance

Security and compliance details require official confirmation. Until confirmed, the document should use careful wording.

- Client data should be treated as confidential and used only for agreed project purposes.
- Access to client systems should be limited to authorized personnel and required project activities.
- Sensitive information should not be exposed through AI responses.
- The AI should avoid making unauthorized legal, medical, financial, or compliance claims.
- Role-based access, encryption, audit logs, and data retention rules may be included depending on the project scope.
- For regulated industries, final compliance responsibility and review should remain with qualified professionals and client management.
- Data storage location, retention period, and third-party AI model usage should be clarified before project launch.

24. Support and Escalation

Support details must be finalized by the CEO. The following structure can be used as a draft support model.

Support Area	Draft Description
Support Channels	Email, ticket system, scheduled meeting, chat, or other channels as confirmed by company policy.
Support Scope	Bug fixes, minor updates, knowledge base updates, performance checks, and guidance as per selected plan.
Escalation	Unclear, sensitive, legal, compliance, pricing, refund, or high-risk queries should be escalated to human team.
Maintenance	Periodic updates may be required when services, pricing, policies, languages, or documents change.
SLA	Response time and resolution time must be confirmed by management before sharing with customers.

25. Related Services

AI Solutions may connect with other company services. This helps RAG answer cross-service questions.

Related Service	Relationship with AI Solutions
Digital Marketing Services	AI can support lead capture, campaign reporting, content ideas, and client query handling.
Cyber Security Solutions	AI deployments may need security review, access control, and data protection planning.
Business Coaching and Mentorship	AI insights and automation can support business growth strategies.
Accounting, Taxation and Compliance	AI can assist client intake and document requirement FAQs, but final advice should be reviewed by experts.
Corporate Law and Contract Drafting	AI can support query intake and document organization, but legal advice requires qualified professionals.
HR Services	AI HR agents can support recruitment, onboarding, policy FAQs, and candidate communication.
Graphic Designing and Brand Development	AI chatbot UI, brand tone, and customer-facing design may need brand alignment.

26. Terms and Conditions

These are draft terms for the AI Solutions service overview. Final terms must align with company policy and legal review.

- The AI solution will be developed according to the approved scope and proposal.
- Any additional features, integrations, languages, or workflows outside approved scope may require a change request and additional charges.
- The customer must provide accurate and updated source information for the knowledge base.
- The company is not responsible for inaccurate AI answers caused by outdated, incomplete, or incorrect client-provided documents.
- AI responses should not be treated as professional legal, tax, accounting, medical, or financial advice unless reviewed and approved by qualified professionals.
- Third-party service fees may apply separately.
- Project timeline depends on timely information, access, feedback, and approvals from the customer.
- Confidentiality and data handling rules will follow the agreement between company and client.
- Refund, cancellation, revision, and support terms must follow official company policy.

27. Sample Deliverables

Actual samples should be added later when provided by the CEO or technical team. For now, this section defines what samples can be included in the final PDF.

Sample Deliverable	Purpose
AI Chatbot Screenshot	Shows how the chatbot appears on the website or platform.
Conversation Examples	Shows how the AI answers FAQs, pricing queries, service scope queries, and unknown queries.
Knowledge Base Folder Structure	Shows how service documents, policies, FAQs, and pricing files are organized for RAG.
Workflow Diagram	Shows the process from customer query to AI response to escalation.
Testing Sheet	Shows tested queries, expected answers, actual answers, and status.
Reporting Dashboard	Shows query count, resolved queries, escalated queries, top topics, and improvement areas.
Handover Document	Shows how client can update documents, review logs, and maintain the AI agent.

28. Service Comparison

This comparison helps customers understand why they may need a customized AI service instead of only a generic chatbot.

Feature	Basic FAQ Chatbot	RAG-Based AI Agent	Custom AI Automation System
Source of answers	Manual FAQs	Approved documents, PDFs, policies, website content	Documents plus workflows, tools, CRM, forms, and APIs
Accuracy control	Limited	Better because answers come from company knowledge base	Highest when combined with business rules, testing, and integrations
Escalation	Basic or none	Can escalate missing or sensitive queries	Can create tickets, notify teams, and update systems
Multilingual support	Limited	Possible with testing	Possible with advanced workflows and regional rules
Business use	Simple support	Customer service and knowledge Q&A	End-to-end business process automation
Cost/complexity	Low	Medium	High/custom

29. Frequently Asked Questions

These FAQs are written in a RAG-friendly format. They can be used directly in the knowledge base.

Q1. What are AI Solutions?

Answer: AI Solutions are services that help businesses use artificial intelligence to automate customer support, lead handling, HR workflows, document-based Q&A, reporting, and other repetitive business processes.

Q2. What is an AI agent?

Answer: An AI agent is a software assistant that can understand user questions, use approved information or tools, and respond or take actions based on defined business rules.

Q3. What is a customer service AI agent?

Answer: It is an AI assistant that answers customer questions using company-approved service documents, FAQs, policies, and website content. It can also collect details and escalate complex queries.

Q4. What is RAG?

Answer: RAG means Retrieval-Augmented Generation. It allows the AI to search approved company documents and generate answers based on retrieved information instead of relying only on general knowledge.

Q5. Why does a company need a knowledge base for AI?

Answer: A knowledge base gives the AI accurate source material. Without proper service documents, FAQs, policies, and pricing guidance, the AI may not answer customer questions correctly.

Q6. Can the AI answer service-related customer queries?

Answer: Yes, if the required service information is available in the knowledge base. The AI can answer scope, process, deliverables, timelines, support, and FAQ-related queries.

Q7. Can AI answer pricing questions?

Answer: AI can explain the pricing model if approved information is available. Exact prices should only be provided if the company has confirmed them for the knowledge base.

Q8. Can AI support multiple languages?

Answer: Yes, multilingual support can be added. Each language should be tested with real customer queries and approved answers.

Q9. Can AI integrate with a website?

Answer: Yes, AI can be integrated with a website through a chatbot widget or custom interface depending on technical requirements.

Q10. Can AI integrate with WhatsApp?

Answer: It may be possible through WhatsApp Business API or approved integration tools if included in the project scope.

Q11. Can AI integrate with CRM?

Answer: Yes, CRM integration may be included so that leads, tickets, or customer details can be captured and routed to the correct team.

Q12. Can AI replace human support completely?

Answer: AI can handle many repetitive queries, but complex, sensitive, legal, financial, or high-risk cases should still be escalated to humans.

Q13. What information is required to build an AI customer service agent?

Answer: Service documents, FAQs, policies, pricing model, website links, sample customer questions, escalation rules, support process, languages, and company contact details are required.

Q14. How long does AI implementation take?

Answer: Simple AI chatbot projects may take 1-3 weeks. RAG-based customer service agents may take 2-6 weeks. Complex enterprise projects require custom timelines.

Q15. What are the deliverables of AI Solutions?

Answer: Deliverables may include AI chatbot, AI agent, knowledge base structure, integration setup, testing report, documentation, training notes, and support plan.

Q16. Will the AI give accurate answers?

Answer: Accuracy depends on the quality of documents, business rules, testing, and ongoing updates. The AI should be trained to avoid answering when information is missing.

Q17. What happens if the AI does not know the answer?

Answer: The AI should say that the information is not available in the current knowledge base and escalate the query or ask the user to contact the company team.

Q18. Can the AI collect customer details?

Answer: Yes, if included in scope, AI can collect name, email, phone, service interest, country, budget range, urgency, and other approved lead details.

Q19. Can the AI book meetings?

Answer: Meeting booking may be possible if integrated with a calendar system and included in the project scope.

Q20. Can the AI send emails?

Answer: Email automation may be possible if integrated and approved in the workflow.

Q21. Can AI help HR teams?

Answer: Yes, AI HR agents can support candidate FAQs, resume screening assistance, interview scheduling support, onboarding Q&A, and policy-related questions.

Q22. Can AI help sales teams?

Answer: Yes, AI can qualify leads, prepare follow-up drafts, explain services, collect requirements, and route leads to sales or BDM teams.

Q23. Can AI help legal or accounting services?

Answer: AI can assist with intake, document requirement FAQs, and general service explanations, but final legal, tax, accounting, or compliance advice should be reviewed by qualified professionals.

Q24. What makes RAG useful for customer support?

Answer: RAG improves answer relevance by retrieving information from approved company documents, reducing the chance of generic or unsupported answers.

Q25. How should documents be prepared for RAG?

Answer: Documents should be service-wise, clear, structured, updated, and include scope, inclusions, exclusions, deliverables, timelines, pricing model, FAQs, terms, and support details.

Q26. Can old PDFs be used in the knowledge base?

Answer: Yes, but they should be checked for outdated information. Outdated or contradictory documents can cause wrong answers.

Q27. What if company policies change?

Answer: The knowledge base must be updated whenever services, pricing, policies, timelines, countries, languages, or contact details change.

Q28. Can the AI answer questions from PDFs?

Answer: Yes, a RAG-based AI assistant can retrieve information from PDF documents if they are readable and properly organized.

Q29. Can AI generate reports?

Answer: Yes, AI can summarize usage data, customer queries, leads, or operational data if reporting is included in the project scope.

Q30. Can AI work 24/7?

Answer: Yes, deployed AI agents can work 24/7, subject to hosting, API availability, and system uptime.

Q31. Is AI suitable for small businesses?

Answer: Yes, small businesses can start with a basic chatbot or customer support assistant and expand later.

Q32. Is AI suitable for enterprises?

Answer: Yes, enterprises can use custom AI solutions with integrations, security review, workflows, reporting, and role-based access.

Q33. What are the main risks in AI projects?

Answer: Main risks include incomplete documents, unclear scope, wrong expectations, weak testing, outdated information, poor integrations, and lack of maintenance.

Q34. How can hallucination be reduced?

Answer: Hallucination can be reduced by using approved documents, clear prompts, retrieval, fallback rules, testing, and escalation when information is missing.

Q35. Can the AI be customized for brand tone?

Answer: Yes, the AI can be instructed to follow a professional, friendly, formal, or brand-specific tone.

Q36. Can the AI be trained on company policies?

Answer: Yes, approved company policy documents can be added to the knowledge base so the AI can answer policy-related questions within allowed boundaries.

Q37. Does AI require maintenance?

Answer: Yes, AI systems need updates when documents, services, pricing, integrations, and customer query patterns change.

Q38. What support is available after deployment?

Answer: Support may include bug fixes, knowledge base updates, improvements, monitoring, and guidance depending on the selected plan.

Q39. Can AI work with customer support tickets?

Answer: Yes, AI can classify tickets, suggest answers, or create support tickets if integrated with a ticketing system.

Q40. Can AI understand customer intent?

Answer: Yes, AI can identify whether a user is asking about pricing, service scope, support, documents, timelines, or contact process.

Q41. Can AI escalate to a human team?

Answer: Yes, escalation rules can be configured for unknown, sensitive, urgent, or high-value queries.

Q42. Can AI be used across 18 countries?

Answer: Yes, but the final countries, languages, compliance rules, and regional details must be confirmed and added to the knowledge base.

Q43. What is needed from the client before starting?

Answer: The client should provide service details, documents, sample queries, process flows, access details if needed, languages, and approval for AI behavior.

Q44. Can the AI answer competitor comparison questions?

Answer: It can answer based on approved positioning. It should avoid making unsupported claims about competitors.

Q45. Can the AI guarantee business results?

Answer: No, AI can improve processes and support efficiency, but business results depend on many factors.

Q46. Can the AI handle refunds, cancellations, or complaints?

Answer: Yes, only if official refund, cancellation, and complaint handling policies are included in the knowledge base.

Q47. Can AI handle confidential data?

Answer: It can be designed with security controls, but data handling rules, third-party AI usage, and compliance requirements must be agreed before deployment.

Q48. What is the difference between chatbot and AI agent?

Answer: A chatbot mainly answers messages, while an AI agent can also use tools, retrieve documents, follow workflows, qualify leads, create tickets, and support actions depending on design.

Q49. Can the customer service agent answer everything?

Answer: No AI should answer everything. It should answer only from approved knowledge and escalate when information is unavailable or sensitive.

Q50. Why are detailed service overview PDFs needed?

Answer: They help the AI answer service-related queries accurately by giving it complete information about scope, process, deliverables, timelines, exclusions, FAQs, and support rules.

30. Information Required from CEO / Management

This section should remain in the draft until the CEO provides confirmed details. It will help complete the final production-ready PDF.

Required Information	Why It Is Needed
Exact list of AI services offered	To avoid offering services the company does not officially provide.
Exact platforms supported	To answer whether website, WhatsApp, CRM, email, Telegram, Slack, or other integrations are available.
Official technology stack	To answer technical and enterprise client questions accurately.
Pricing model and package details	To answer pricing-related queries safely and consistently.
Support hours and SLA	To answer support and response time questions.
Deployment options	To answer cloud, on-premise, hybrid, or website deployment queries.
Security and compliance standards	To answer enterprise, legal, data privacy, and regulated-industry questions.
Official countries served	To answer geography and availability questions.
Official language list	To answer multilingual support questions.
Sample deliverables/screenshots	To make the PDF more practical and improve customer trust.
Refund/cancellation/revision policy	To answer contract and service policy questions.
Escalation process	To define when AI should send the customer to human support.

RAG Implementation Notes for Knowledge Base

To make this document work better for RAG, the following practices are recommended:

- Keep one dedicated PDF per major service category.
- Use consistent headings across all services: Overview, Problems, Scope, Inclusions, Exclusions, Workflow, Timeline, Deliverables, Pricing, FAQs, Terms, Support.
- Add a separate FAQ section with direct question-answer format.
- Avoid contradictory information across documents.
- Add "To be confirmed" only in draft files. Remove or finalize these before production use.
- Use clear tables for timelines, deliverables, packages, and responsibilities.
- Add sample customer queries and approved answers for each service.
- Create separate folders for each service in the knowledge base.
- Update documents whenever company services, prices, policies, or countries change.
- Test the AI agent with at least 100 sample queries before launch.
